Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA

'n,

09

```
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(1) use of thin aggregative finbriae (SERIA/TAPA) mucleation depended assembly system of strains of Salmonella Escherichia coli and cassembly system of strains of Salmonella Escherichia coli and directing recombination of finbriae comprising recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, comprising separating a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining a replacement segment or segments of foreign amino cortaining an amino acid polywer or segments of foreign amino cortaining an amino containing a replacement segment or segments of foreign amino cortain and the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which may be important for an efficient live vaccine, the darrier fimbrial submult protein sare usually strong immunogens, which may be important for directing an immune response conceptive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                             Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 138; 139pp; English

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(1) use of thin aggregative fimbriae (SEF1/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant depended affA. CsgA and AgfA. Homologue fimbrin subunits, respectively; (2) directing recombinant denomologues species; (3) directing recombinant gene homologous species; (3) directing recombinant gene are compliant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising are combinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and inroducing the protein containing a replacement segment of recombinant AgfA protein which the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein high numbers (up to 500,000 copies/cell), the hybrid fimbrian protein possesses both the system the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                        Salmonella, agfA, chromosomal gene replacement, fimbrin, epitope, vaccine, immune response; immunogen.
                                                                                                                                                    AgfA::PT3#1 amino acid sequence SEQ ID NO:12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kay WW;

```
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEPI)/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant C AgFA, CsgA and AgfA-homologue fimbria subunits, respectively; (2) directing recombinant gene into the chromosome of the homologue species, replacing the native composition species, (3) directing recombinant gene into the chromosome of the homologue species, replacing the native corp. of that gene, and (4) eliciting an immune response in an animal, comprising separating a replacement segment or segments of foreign amino protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment of segment or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or segments or seg

                                                                         ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (I) use of thin aggregative fimbriae (SEFI7/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of imbriae comprising recombinant AgfA, CsgA and AgfA-homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologues species; (3) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                  120

Also described are:
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copiess/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and haspensive to purify in large amount. The present sequence is given it the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDYDQLVTRVVTHEMAHALQ

assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant by GIAA, CSGA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species, replacing enemblacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 10,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response in an immune response in an immune response in an immune response in manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual manual m

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SPRIJ/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enerotacteriaceae for the production of fimbriae comprising recombinant of Enerotacteriaceae for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant of the native comprising separating an amino acid polymer comprising a recombinant of the comprising separating an amino acid polymer comprising a recombinant of corein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to system the hererologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial submit proteins are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for directing an immune response consequence in singerted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention present sequence is given i

Also described are: (1) use of thin aggregative fimbries (SPETAT/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbries comprising recombinant of Enterobacteriaceae for the production of fimbries comprising recombinant gene into the chromosome of the homologous species, (3) directing recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising recombinant and comprising separating an amino acid polymer comprising recombinant of protein containing a replacement segment or segments of foreign amino acid segments of comprising a replacement segment or segments of correction containing a replacement segment or segments of correction and throughout protein containing a namino acid polymer comprising in recombinant AgfA protein containing a replacement segment or segments of correction containing a namino acid polymer confinents of conficient are useful for acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the coliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens and naminal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to confice the carrier fimbrial subunit proteins are usually strong manumomorphic properties relevant for an efficient live carrier of municogenist and adhesion properties relevant for an efficient live administ the inserted epitope, and hybrid fimbria are usually strong inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention are easy and
                                                                                                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                  Kay WW;

The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shighla infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infections
Plasma protein; immune response; antibacterial; vaccine; gene therapy.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Publication No. US2030303963A1

GENERAL INFORMATION:
A COMPUTATION OF Scientific and Industrial Research
TITLE OF INVENTION: A COMPUTATIONAL METHOD FOR THE IDENTIFICATION OF CANDIDATE PROTE
TITLE OF INVENTION: USEFUL AS ANTI-INFECTIVES
FILE REPERENCE: 063915
CURRENT APPLICATION NUMBER: US/09/820,843A
CURRENT FILING DATE: 2001-03-30
NUMBER OF SEQ ID NOS: 118
SOFTWARE: Patentin version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        73 SGYGNGADYDQLVTRVVTHEMAHAFRNNATIDQWNAKNS---DITVGQYGGNNAALVNQT 129
